

How to Prepare MCSA, MCSE and MCP Exam

Languages: French, English, Polynesian, German and Japanese

Audiences: IT Professionals

Associated certifications: MCSA, MCSE and MCP

Exam Topics

Before we start our explanation of how to prepare for MCSA, MCSE and MCP exam, we must understand that the set topics exploring whether the candidate fully understands the technical tasks or not. The marked percentages for all of the topics have been added, so that the candidate may understand which topics carry the most importance.

Configure network services and access (15-20%):

The third topic within the certification exam involves the configuration of network services. The examiner will also critically study the configuration of DNS zones, along with the candidate's ability to work on virtual and private networks. In this regard, it will be very helpful if the candidate is also aware of routing techniques along with Direct Access.

Configure File and Print Services (15-20%):

The configuration of file and print services involves the configuration of the Distributed File System, along with knowledge of the File Server Resource Manager. The candidate should demonstrate heightened awareness of how file and disk encryption take place, and how audit policies can be advanced.

Deploy, Manage, and Maintain servers (15-20%):

This is the first subtopic. Here we look at the candidate's ability to manage booting, besides configuration. The candidate must also be able to install images and discover them. It is essential that the candidate know how to work with both hotfixes and drivers packages. Furthermore, he or she should know how to configure the hotfixes and drivers, should the need to do so arise. Whether or not one can configure group policies, perform WSUS synchronization will also be studied. It would be preferable if the candidate also exhibited awareness of how to manage patch management within a mixed environment. The topic would further include the configuration of data collector sets, besides the scheduling of performances, along with the monitoring of real time performance, takes place.

Configure a Network Policy Server (NPS) infrastructure (10-15%):

The fourth topic of the certification exam involves the configuration of the network policy server. The test-taker should also know how to configure the Network Policy Server, besides possessing awareness of how to configure NPS policies. Understanding Network Access Protection is also highly important in this regard.

Configure and manage Active Directory (10-15%):

Here, it is crucial that the candidate know how to not just manage active directories, but configure them as well. They must also be able to configure service authentication and the examiner will also be considerably impressed if the candidate is able to install domain controllers, configure account policies, their settings and apply PSOs (Password Setting Objects).

Configure and manage Group Policy (15-20%):

Last but not least, the examiner will want to know whether the candidate could manage and configure group policies.

Best Preparatory Material
